Art Unit: 2174

DETAILED ACTION

- 1. This application has been examined. The RCE and Amendment filed 5/27/05 have been entered.
- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-7, 11-17, 19-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kalluri et al (5937331) and Winkel (6151709) and Chess et al (5802592).
- 4. Regarding claim 1, Kalluri et al show a client system with computer and program instructions communicating with a server (Abstract, Figure 1, column 2 lines 25-40), a method of restoring a corrupted portion of program instructions at the client (column 5 lines 25-45) including: checking the validity of system program instructions and application program instructions at the client to determine if a corrupted portion exists (column 6 lines 18-47), and upon determining that either have a corrupted portion, receiving replacement instructions for the corrupted portion from the server (column 5 lines 30-45, column 6 lines 20-50), and replacing the corrupted portion with

Application/Control Number: 09/851,402

Art Unit: 2174

the replacement instructions (column 9 lines 25-55). Kalluri et al do not go into the details of the connecting to the server upon making the determination that a corrupted portion exists, but do mention efficiently providing a way to obtain replacement instructions. Furthermore, Winkel do show connecting to the server to retrieve replacement instructions when a corrupted portion is determined (Figures 2 and 4. column 2 lines 10-19, column 3 lines 5-23 and 29-40, column 4 lines 19-36 and 53-64) to efficiently obtain replacement instructions. It would have been obvious to a person with ordinary skill in the art to have Kalluri et al connect to the server upon making the determination that a corrupted portion exists, to efficiently providing a way to obtain replacement instructions. Kalluri et al do not go into the specific details of the instructions being in an actual program which is replaced per se, but do show correction of instructions with programs (column 8 lines 52-67). Furthermore, Chess et al show replacing an actual program if it is corrupted, to correct instructions (column 3 lines 30-50). It would have been obvious to a person with ordinary skill in the art to have an actual program replaced in Kalluri et al, because it would be an efficient way to correct instructions.

Page 3

- 5. Regarding claim 2, validity check uses a checksum technique (Kalluri et al Figure 4, column 7 lines 10-20).
- 6. Regarding claim 3, the act of connecting the client to the server includes selecting a local connection script associated with the server (Winkel column 5 lines 5-

Art Unit: 2174

20 which is part of the process of connecting to the server which is obvious to combine into Kalluri et al as explained in paragraph 4 of this Office Action).

- 7. Regarding claim 4, a default connection script is read from the memory of the client to connect to a remote computer and the selected local script is downloaded (Winkel column 5 lines 10-25 which is part of the process of connecting to the server which is obvious to combine into Kalluri et al as explained in paragraph 4 of this Office Action).
- 8. Regarding claim 5, the replacement instructions are automatically (without user intervention) requested and received (Kalluri et al column 9 lines 20-49). Given then obviousness to have the connection to the server, this would thus happen after the connection is made.
- 9. Regarding claim 6, the replacement instructions are received through a satellite link (Kalluri et al column 5 lines 5-25).
- 10. Regarding claim 7, the replacement instructions are written to a random access memory, decompressed, and written to a flash memory of the client (Kalluri et al column 7 lines 20-49).

Art Unit: 2174

11. Regarding claim 11, validity is checked during initialization (Kalluri et al column 6 lines 18-47).

- 12. Claims 12-13 show the same features as claims 1-2 respectively and are rejected for the same reasons.
- 13. Claim 14 shows the same features as claim 7 and is rejected for the same reasons.
- 14. Regarding claim 15, an example of this is checking validity upon an initialization sequence, and thus this is rejected for the same reasons as claim 12.
- 15. Claims 16-17 are rejected for the same reasons as claims 1-2. In addition, note that the portion being represented as a block is inherent.
 - 16. Claims 19-20 are rejected for the same reasons as claims 6-7.
- 17. Claim 21 shows the same features as claim 6 and is rejected for the same reasons.

18. Regarding claim 22, checking validity comprises identifying specific addresses associated with the identified corrupted blocks (Kalluri et al column 6 lines 25-50).

- 19. Claim 23 is rejected for the same reasons as claim 7.
- 20. Claim 24 is rejected for the same reasons as claim 5.
- 21. Claims 25-26 are rejected for the same reasons as clams 16-17.
- 22. Claim 27 is rejected for the same reasons as claim 23 (and claim 7).
- 23. Claim 28 is rejected for the same reasons as claim 15.
- 24. Claim 29 is rejected for the same reasons as claim 22.
- 25. Claims 8-9 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kalluri et al (5937331) and Winkel (6151709) and Chess et al (5802592) and Reed et al (5903732).
- 26. Regarding claim 8, neither Kalluri et al nor Chess et al show specifically the instructions received over the Internet, but Kalluri et al do show receiving over a

Art Unit: 2174

network. Furthermore, Reed et al show receiving validity instructions over the Internet as a useful network (column 6 lines 1-30). It would have been obvious to a person with ordinary skill in the art to have Kalluri et al use the Internet, because it would provide a useful Internet from which to receive the instructions.

- 27. Regarding claim 9, neither Kalluri et al nor Chess et al specifically mention the browser having the corrupted portion, but Kalluri et al do show the application program at the client for receiving the data for presentation (column 5 lines 40-55). Furthermore, Reed et al do show the browser for presenting data at the client (column 4 lines 40-55). It would have been obvious to a person with ordinary skill in the art to have this in Kalluri et, because it would provide a convenient application to present data at the client.
 - 28. Claim 18 is rejected for the same reasons as claim 8.
- 29. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kalluri et al (5937331) and Winkel (6151709) and Chess et al (5802592) and Fowlow (6260078).
- 30. Regarding claim 10, Kalluri et al and Chess et al do not specifically show the Java applet, but it is common in the art to use Java applets to transmit instructions over a network (see for example Fowlow column 3 lines 25-60). Kalluri et al shows

Application/Control Number: 09/851,402

Art Unit: 2174

transmitting instructions over the network. It would have been obvious to a person with ordinary skill in the art to use Java applets in the invention of Reed et al, because it would be an efficient way to transmit instructions over the network.

Page 8

- 31. Applicant's arguments with respect to the claims have been considered but are most in view of the new ground(s) of rejection. Applicants focus on connecting to the server upon determination that the corrupted portion exists, and it is regarding this feature that the new art (Winkel) is applied. Also it is noted that applicants acknowledge that Kalluri et al do show the redundancy mechanism for recovery from corrupted trigger commands.
- 32. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Steven P. Sax whose telephone number is (571) 272-4072. The examiner can normally be reached on Monday thru Friday, 8:30 AM 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kristine Kincaid can be reached on (571) 272-4063. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
